2 API Documentation

2.1 Introduction

Digitap.ai Validation Suite provides RESTful/standard HTTP Web APIs which help to validate a specific data point by providing the response synchronously in the same API Call. The API uses the standard HTTP status/response codes to indicate the success or API errors.

2.2 Authentication

To use the API, one needs to register with Digitap and get a client id & client secret key. The client ID & secret key are different for the UAT & production environment.

2.3 API Request & Response Format

- Both the input request and response follow the JSON format.
- In each APIs input, a client reference number is accepted to easily identify the given request from a client and the same is also mirrored in the output. The other parameters required in the input and their format are explained in specific APIs.
- The API error is normally returned as standard HTTP Status/Response Codes and also mirrored in the body of the response.
- When the API request is accepted, HTTP status code 200 is returned and whether the validation is successful or not is returned in the result_code. The various possible values of the validation is explained under the section “API Result”
- In all the responses, an unique request-id would be returned, which can be used for easier debugging in the future. Clients are requested to provide this request-id when raising an issue or discussing the response.

2.4 HTTP Status/Response Codes and its response body format

The API Error Codes are returned as HTTP Status Codes. Following status codes would be returned by the APIs.

Code	Message	Description
200	OK	Request Successful <i>(Note: 200 does not mean that Validation is success, but indicates that the request is successful. result_code in the Response body indicates whether the validation is successful or not).</i>

400	One or more parameters format is wrong	Input parameter passed by the customer is missing or invalid
401	Client Authentication failed	Access to API is denied
500	Internal Error	Internal Server Error identified through its number
503	Website is in maintenance	The source for authentication is down for maintenance or inaccessible.
504	Endpoint request Timed out	The response latency from the source for authentication is >30sec.

Format of the response body for successful request case (http Status code 200) is like below:

```
{
  "http_response_code": 200,
  "client_ref_num": "abcd123",
  "request_id": "97a9f2ce-cd70-11ea-ba26-4ef9447da577",

  "result_code":nnn,

  // Optional items based on result_code
  "result":nnn,
  "message": "yyy",
}
```

Format of the response body for failure cases (http Status code other than 200) is like below:

```
{
  "http_response_code": nnn,
  "client_ref_num": "abcd123",
  "request_id": "97a9f2ce-cd70-11ea-ba26-4ef9447da577",
  "error": "xxxx"
}
```

2.4.1 Error Messages

Error messages for each of the failure cases is given below:

Code	Error Message
400	One or more parameters format is wrong or missing
401	Client Authentication Failed

500	Internal Error
503	Website is in maintenance
504	Endpoint request Timed out

Please see the respective APIs for any additional details.

2.5 API Result

When the API returns HTTP status code 200/OK, the API request is accepted and result of the request is provided in the key called “**result_code**” in the response body:

```
{
  "http_response_code": 200,
  "client_ref_num": "abcd123"
  "request_id": "97a9f2ce-cd70-11ea-ba26-4ef9447da577",
  "result_code": nnn,
}
```

Various possible values of **result_code** and is tabled below:

result_code	Description
101	Validation Successful
102	Invalid id number or combination of inputs
103	No record found for the given input
104	Source failed to respond with proper details
105	Unexpected Response from source
106	Multiple records exists

Please see the respective APIs for details of which result code occurs in the specific API.

2.6 Additional Notes

26 Company Docs Advanced API

26.1 API Introduction

The Company Docs Advanced API is a comprehensive solution for retrieving critical company documents necessary for compliance, verification, and due diligence. This API accepts a Company Identification Number (CIN) or Permanent Account Number (PAN) as input and provides secure, downloadable links to essential documents such as the Company Incorporation Certificate, Articles of Association (AoA), Memorandum of Association (MoA), Share-Holding Pattern, and the latest audited balance sheet and annual report. The API uses an asynchronous design to ensure high efficiency, minimize response time dependencies, and enable scalable parallel processing, making it ideal for handling large volumes of requests in real-time.

26.2 Request API

26.2.1 API URL

Following are the **URLs** for UAT & production Environment.

UAT/DEMO Env	https://svcdemo.digitap.work/validation/kyb/v1/company_docs_advanced/request
Production Env	https://svc.digitap.ai/validation/kyb/v1/company_docs_advanced/request

26.2.2 API Request

27 PAN to GST Details

27.1 API Introduction

This API creates a unified API endpoint that, given a PAN number, returns the detailed GST profile(s) linked to it. This API stitches together the GST Search by PAN API (to fetch associated GSTINs) and the GST Details API (to fetch GSTIN-wise details).

27.2 API URL

Following are the **URLs** for UAT & production Environment.

UAT/DEMO Env	https://svcdemo.digitap.work/validation/kyb/v1/pan_to_gst_details
Production Env	https://svc.digitap.ai/validation/kyb/v1/pan_to_gst_details

27.3 API Request

- **Endpoint:** <base_url>/validation/kyb/v1/fssai_validation
- **Method:** POST
- **Header:**

Key	Mandatory/Optional (M/O)	Value
content-type	M	application/json
authorization	M	Type: Basic Auth, Username:client_id, password:client_secret / BasicBase64encodedValueOf (client_id:client_secret)

- **Request Body:**

Key	Mandatory/Optional (M/O)	Value
client_ref_num	M	Unique ID for this request from the Client side [Max of 45 chars]
pan	M	The Permanent Account Number (PAN) of the business. This field should contain a valid 10-character PAN (e.g., ABCDE1234F). RegEx - <code>^[A-Z]{5}[0-9]{4}[A-Z]{1}\$</code>

27.4 API Response

The API supports configurable modes for GST authentication. Clients can choose between **Basic** and **Advanced** authentication, both of which accept the same input structure but differ in the level of detail provided in the output. The GSTINs used as input are obtained from the **GST Search by PAN** API, and the selected authentication mode is applied to each GSTIN. Additionally, a configuration flag allows filtering by GSTIN status, enabling clients to run authentication either on **all GSTINs** returned or only on those that are **active**, depending on their requirement.

Please contact the sales team to get this enabled according to your requirements.

34 LEI Basic Validation API

34.1 API Introduction

The **LEI Basic Validation API** provides access to globally-standardized **Legal Entity Identifier (LEI)** information for entities registered in India. Using the LEI code, CIN or LLPN as the input parameter, the API returns verified legal entity details such as official name, registration status, jurisdiction, regulator, and validity - enabling accurate identification for compliance, risk management, and regulatory reporting. In India, LEIs are mandated for companies engaging in regulated financial markets (such as securities trading and derivatives) and for large corporate borrowers under directives from regulators like the **Reserve Bank of India (RBI)** and securities market authorities.

34.2 API URL

Following are the **URLs** for UAT & production Environment.
