1 API Documentation

1.1 Introduction

This document is intended for our enterprise partners who can easily integrate the services they have chosen with Digitap.ai. Using this document they can jumpstart their business processes and start using the Digitap.ai services as early as possible and also align their own business processes seamlessly by integrating and making changes to their backend. Digitap.ai Credit Score Check Suite provides an API related to assessing the credit report along with the credit score of a customer.

1.2 Authentication

To use API, one needs to register with Digitap and get a client id & client secret key. The client ID & secret key are different for the UAT & production environment.

1.3 API URLs

Following is the **base URL** for UAT & production Environment.

Production Env	https://api.digitap.ai/
UAT/DEMO Env	https://apidemo.digitap.work/

1.4 Request API Input & Response Format

1.4.1 API Request

1.6 API Encryption

Digitap APIs offer an option to enable **JWE encryption**, allowing the request payload to be sent and the response to be received in an **encrypted format**.

Encryption:

Following is the method to encrypt the request payload for the API :

- Construct the request payload that needs to be sent to the server based on the specific API
- Stringify the JSON request payload.
- Create the JWE (*JSON Web Encryption*) Token for the above text using Digitap public key provided and one of the secure JWE Algorithm & Encryption methods (*we suggest to use "alg" as RSA-OAEP-256 and "enc" as A256GCM for speed*).
- Set the above JWE Token generated as the value for the **"encrypted_data"** and pass this payload to the API.

Sample Request Payload :

For the sample payload,

```
{
  "client_ref_num": "Test123",
  "mobile_no": "7908096603",
  "name_lookup": 0,
  "first_name": "Shubhra",
  "last_name": "Dutta",
  "consent_message": "I hereby authorize Experian to pull my credit report for
test purpose",
  "consent_acceptance": "Yes",
  "device_type": "web",
  "otp": "6307",
  "timestamp": "14082024-13:07:20",
  "device_ip": "192.168.67.1"
}
```

the following would be an encrypted payload.

```
{
  "encrypted_data":
  "eyJlbmMiOiJBMjU2R0NNliwiYWxnIjoiUINBLU9BRVAtMjU2Ln0.ks48nUM

```

Decryption:

Following is the method to decrypt the response payload received from the API :

- Get the data received in the “encrypted_data” field from the payload.
- Decrypt the above text using JWE method with your private key (*corresponding public key needs to be shared with the Digitap*)
- The decrypted data would be having the response in the format as given in the specified API.

Sample Response Payload :

For the sample response,

```
{
  "http_response_code": 200,
  "client_ref_num": "Test123",
  "request_id": "b18e7c0c-88f4-4a5c-bccc-efe907a5e76c",
  "result_code": 101,
  "message": "success",
  "result": {
    "result_json": {
      .....
      .....
    }
  }
}
```

the following would be an encrypted response given by the API.

```
{
  "encrypted_data":
  "eyJlbmMiOiJBMjU2R0NNIiwiaWVWxnljoiUINBLU9BRVAtMjU2In0.ks48nUM

```

Note :

- Clients need to generate the private-Public Key and provide the public key to Digitap. One can generate the public key using OpenSSH or a website like <https://cryptotools.net/rsagen>. We recommend using 1024 bits for speed of decryption. Clients can choose the bit length based on their infosec guidelines.
- Clients can get the Digitap Public Key by contacting the SM(Sales Manager).
- Only specific APIs support encryption and decryption. Please refer to the specific API to check whether encryption is supported in the specific API section. If you require Encryption in other APIs, please raise the request to the SM(Sales Manager).

Error Message related to Encryption:

When the encryption method is used for sending the data to the API, the response would be received in encrypted format including the error messages. However, some responses occurring at the infra level or initial validation would be in non-encrypted manner. Few cases where the response would be in non-encrypted manner are:

- Rate Limiting Error
- DNS or Load Balancer Errors

Apart from the error messages provided in [Result code master](#) attached below, following additional status code/errors may occur when encryption is being used.

Code	Error Message	Description
401	Invalid Encryption	JWE decryption failed at Digitap due to error in encrypted data
451	Misconfiguration	Encryption is not enabled for the client

1.7 Result Code and Its Explanation

Various possible values of **result_code** and is tabled below:

result_code	Description
101	Record Found successfully
102	Need to hit Request API again (Only in txn expiry scenario)

1.8 Error Messages

Error messages for each of the failure cases is given below:

HTTP Response Status Code	Error Message	description
400	One or more key format is wrong	One or more key format is wrong
401	client authentication failed	This error occurs when the client (such as an application or user) fails to prove its identity to the server.
401	name look-up service is not enabled	The name look-up service is not enabled

503	source error	There is an issue with the source of the data being processed.
500	internal server error	The server encountered an unexpected condition that prevented it from fulfilling the request

2.0 Sample dataset for Testing in UAT

In UAT, we have sample test cases available. Please use the following data points to test the API in the UAT environment.

First Name	Last Name	DOB (DD-MM-YYYY)	PAN	Mobile No	Email
Shubhra	Dutta	1991-09-24	FAWPD4345T	7908096603	shubhra.dutta@digitap.ai

Sukhjinder	Singh	1990-08-19	TGHPS7231K	9822616123	sukhjinder@digitap.ai
Trisha	Dhawe	1990-07-17	WLCPD4323E	9584324371	trisha.dhawe@digitap.ai

2.1 Additional Notes

- API will be billable for any successful response with result_code 101
- The user must provide consent via the OTP verification, and the same OTP is to be given in the request payload. The flow for the same should be integrated at your end.
